

MicroSoil®

MicroSoil® is an organic soil conditioner composed in a concentrated suspension of natural beneficial organisms, enzymes, and specific activators and bio-nutrients: minerals, vitamins, polysaccharides and polypeptides.

With MicroSoil® the soil structure is improved, contributing to greater root development in the rhizosphere, especially the root hairs, allowing the plant better absorption of more nutrients, which results in significant benefits for the cultivation and translates into increased profitability.

- With Microsoil® the plant grows stronger and more resistant to any stressful situation.
- MicroSoil® improves the quality of the fruit and offers more commercial advantages.

MicroSoil® increases the amount of microorganisms in the soil that fix nitrogen and mineralized macro and micronutrients, improving the physio-chemical conditions of the rhizosphere and positively influencing the decomposition of organic matter.

These new soil conditions increase the yield and quality of crops.

With better nutrition, plant performance and crop quality increase.

MicroSoil® also improves the soil-water relationship, contributing to a more efficient use of water resources.
